

## CANpro PCI Express

Universal PCI Express boards with onboard microcontroller

Single and dual channel interface boards in PCI Express format for use in CAN and CANopen networks.

### **FLEXIBLE INTERFACE FOR STANDARD SOFTWARE AND SELF-DEVELOPED APPLICATIONS**

CANpro PCI Express allows PC applications to exchange data with the connected CAN bus. Available in single and dual channel versions with a flexible programming interface, and in a low profile version for ultra compact PC systems, CANpro PCI Express is a universal interface solution for almost any CAN application - whether it's bus analyzers, machine controllers or test rigs.

### **RAPID INTEGRATION WITH THE RIGHT SOFTWARE INTERFACE**

CANpro PCI Express provides an API that can be optimally configured to the application's requirements. In FIFO mode, all sent and received messages are buffered to ensure that no data is lost when the computer is busy with other work. The Object Buffer mode allows the application to filter messages of interest, and automatically buffers the data recently received by the application. The application can use this data when needed, and is not burdened with the other messages. The CANpro PCI Express interface board can automatically transmit the data on the bus in exact, individually configurable cycles.

A CANopen Client API is also included for use in CANopen networks.

Sample projects with commented source code demonstrate how the boards are used with C, C# or VB.Net.

### **CUSTOMER BENEFITS**

- > Low profile version allows ultra compact systems
- > Optimum integration through flexible API
- > Quick and easy to get started thanks to many source code samples
